

Encrypted Webmail

Designed for easy exchange of encrypted information

Encrypted Webmail provides Public Key Infrastructure based encryption and signing capabilities, allows for large file sizes, and since it is cloud-based, there is no hardware or software to install, so it's fast and easy to implement. Along with common mail features such as print, reply, reply-all, save, and delete, Encrypted Webmail provides full audit, tracking, and notification functionality to enable verification of delivery, receipt and opening of messages.

Whether your users are in the office, or using mobile iOS, Android or BlackBerry devices on the road, sending, receiving and sharing sensitive data is easy and protected.

Features:

- 100% Web based experience, no applications or plug-ins to download or install
- Messages readable on any device
- Secured with the most stringent security standards
- Supports branding options
- Full audit and tracking capability around message access
- Messages are digitally signed and validated for compliance
- Supports large file attachment sizes
- Mobile optimized (iOS, Android, Blackberry)
- Self registration and user generated password
- Mandatory password recovery questions
- Provides secure message reply
- Receipt and read notification capabilities
- Support for 21 languages including double-byte languages (Chinese and Japanese)

Benefits

- Puts control back in the hands of your IT with central management of usage and signatures, eliminating need to deploy and maintain expensive third party PKI or Certification Authorities.
- Helps you support your brand or brands through text and images to control the look and feel of your messages and portal, along with notification and activation emails.
- Helps strengthen your relations with key business partners by enabling disparate users to share confidential information.
- Helps organizations meet compliance regulations, through easily accessible usage monitoring and reporting.
- Comprehensive security and protection for your sensitive email messages rendering them unreadable by hackers or even IT department.

Encrypted Webmail

Stringent Security. Easy to Use.

Optimized for all mobile devices and tablets, the messages never leave the security of our SSAE 16 SOC2 Type II certified data centres, instead, they are encrypted using S/MIME and stored, while a notification email is sent to the recipient’s email address informing them that they’ve received an encrypted message.

The powerful web-based administration console helps you control the look and feel of your message pickup portal, along with notification and activation emails. While the analytics tool tracks every single message that has been processed and provides a snapshot of the system through summary diagrams.

Detailed searchable reports identify important information such as the most flagged policies, the highest offenders, bounce backs, device type open, and email opened, viewed for how long, forwarded, and recalled.

The Echoworx Advantage

100% Encryption Focused

OneWorld encryption, is the first smart message encryption platform—designed to adapt to any environment. With over 1+ million users and 5000 deployments in 30 countries.

Agile. Responsive. Passionate.

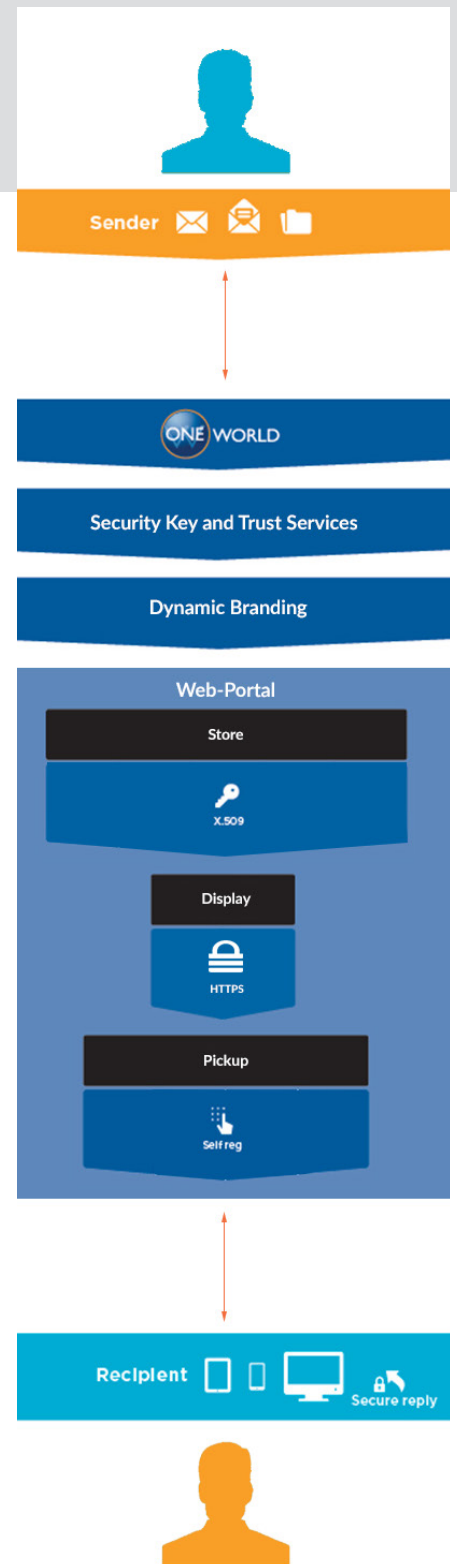

Our passionate encryption experts take the complexity out of encryption for world leading enterprises.

Trusted Root Certificate Authority

Echoworx is a WebTrust audited Certificate Authority (CA) trusted by the Apple and Microsoft CA Programs offering multiple, SSAE 16 SOC2 Type II certified secure, independently operated data centres in the US, Canada, and Europe.

World Class PKI

Our world class PKI Infrastructure offers IT administrators full certificate and key management (backup, expiry, escrow, revocation and rollover).
